

Olivine Transport Cost — January 2026 Status

Sep 23, 2026 · @Someone

Three transport-cost families were imported from Olivine's January 2026 workbook. One (3rd Party) is live and posting to the report; two (Vansales and Swift) are imported but blocked from posting, each for a distinct and documented reason described below.

Which screen to show Olivine

Open **Cost & Finance → Transport Cost**, filtered to **January 2026**. This screen reads only posted data — it never shows raw imported rows, so everything visible there has already passed identity confirmation and been posted to the ledger.

- Use the **Export exceptions** button on the report to hand Olivine a CSV of every source row that has not posted yet, with its reason — useful if they ask about the rest of January.
- Do not open the normalization review queue or any import/CLI output in the meeting — those are internal working tools, not something Olivine needs to see.

What's live — 3rd Party

109 rows in Olivine's January sheet.

- 7 failed import validation (missing required fields) and were never imported.
- 90 imported successfully as source records (after removing duplicate re-imports — see "Data cleanup performed" below).
- Of those 90: **73 have posted** to the ledger and are visible on the report page now. **17 are still pending** — their amount field is blank in Olivine's own spreadsheet. Nothing is lost; they post automatically once Olivine fills in the missing figures and we re-run posting.

What's outstanding — Vansales

46 rows in Olivine's January sheet; 3 failed import validation, 43 imported successfully (after dedup).

- **0 posted.** Every Vansales row is blocked for the same reason: pending amount.

- Why: a Vansales posting reads only the TOTAL figure Olivine enters per payer — never the weekly breakdown columns, which are informational only. In the real January sheet, only 1 of 46 TOTAL cells has a value, and that one row is itself a subtotal/footer line with no payer name, so it was correctly rejected on import.
- This is a gap in Olivine's own source data, not a system defect. **Action item for Olivine:** fill in the TOTAL column per payer for January. Once that's done, posting takes minutes on our side.

What's outstanding — Swift

281 rows in Olivine's January sheet; 5 failed import validation, 276 imported successfully (after dedup).

- **0 posted, and none will post as the source data is structured today.** This is permanent, not a backlog item.
- Why: every ledger posting requires a vehicle. Swift's source sheet has no registration, vehicle, or transporter column at all — there is nothing in the data to resolve a vehicle identity from, for any row.
- This needs a **business decision from Olivine**, not more import work: either add a vehicle/transporter identifier to the Swift source data going forward, or decide how Swift costs should be attributed on the report without a per-vehicle link. Until one of those happens, Swift costs stay imported (visible to us for reconciliation) but off the report page.

Data cleanup performed

Before this review, an earlier full re-import of the January file silently created a second copy of every Vansales and Swift row — duplicate detection only works when both a registration and a date are present, and neither family has both. 319 duplicate rows were identified, verified byte-for-byte against the originals, and safely removed (soft-deleted, fully recoverable) on 2026-09-23. The 3rd Party family was never affected — its duplicate check caught re-imports correctly from the start. The counts above already reflect this cleanup.

Next steps

Family	Status	Next action	Owner
3rd Party	73/90 posted	Fill in amounts for the 17 blank rows, then re-run posting	Olivine
Vansales	0/43 posted	Fill in the TOTAL column per payer for January	Olivine
Swift	0/276 posted	Decide how to attribute Swift costs without a vehicle identifier	Olivine (business decision)

Once Olivine provides the above, posting is a single command on our side and takes minutes — no further import work is needed for January.
